Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

## Description

[0001] This Application is directed to a fuse combination including a plurality of fuse elements on an insulative support, as well as a method of making the combination and its use in an electrical circuit.

[0002] Such a fuse combination and a method of making the same is shown for example in US-A-4 498 068.

## BACKGROUND OF THE INVENTION

[0003] A typical prior art device, on which the present invention is an improvement, is shown in Figure 11. Fuses 1 comprise fusible portions 2 which, in this case, are connected to a single unnumbered connector. Fuses 1 are stamped out of a conductive metal plate and, to predetermine the capacity of the fuses, fusible portions 2 are cut narrower than the remainder of the fuse. However, this is very difficult to do when stamping a metal plate, and thus is not entirely satisfactory. On the other hand, if a thinner metal plate is used, this will also cause the fusible portions to be thinner and permit control of the current flowing. However, the remainder of the fuses will also be thinner and will be difficult to connect to other terminals.

## SUMMARY OF THE INVENTION

[0004] The present invention is intended to provide a fuse combination which can be stamped from sheet metal and can be designed so that it will limit the circuit in which it is placed to a low current capacity. In addition, this invention includes contacts of sufficient strength and thickness so that they can readily be inserted into other terminals.

[0005] There is provided a fuse combination having a plurality of fuse elements arranged in a plane on an insulative support. The fuse elements are generally elongated in shape and have first and second contacts with fusible portions therebetween. The latter are of shallower depths than the former.

[0006] The fuse elements are arranged in parallel and spaced apart from each other. A first band connects adjacent first contacts at their ends and, in a preferred form of the invention, a second band connects the second contacts at their ends. In this way, the plurality of fuse elements is held in proper spaced relationship.

[0007] An insulative support, generally complementary to the plane of the fuse elements, is also provided. One dimension of the support is shorter than the distance between the ends of the fuse elements. In this way, the outer ends of the first and second contacts extend beyond the insulative support.

[0008] The support also is provided with cavities which correspond to the fusible portions of the fuse elements. The fusible portions are placed on the support so that the fusible elements traverse the cavities. In a preferred form of the invention, the cavities are actually

holes completely through the support. The fuse elements and the support are fixed together to complete the fuse combination.

[0009] Preferably, the combination is then bent into a U-shape about an axis transverse to the elongated fuse elements and passing through the cavities or holes. It has been found particularly useful if the support is weakened along the foregoing axis in order to provide a bending hinge.

[0010] A cover, preferably transparent, is placed over the fusible portions to protect them. Since the cover is transparent, if a fuse has melted, it can readily be determined by visual inspection. The combination, with the first and second contacts protruding beyond the support, can then be inserted into a complementary socket.

[0011] In the accompanying drawings, constituting a part hereof, and in which like reference characters indicate like parts,

- 20 Figure 1 is an exploded perspective view of the fuse elements and insulative support;
- Figure 2 is a perspective view of the fuse elements placed on the support;
- 25 Figure 3 is a perspective view of the fuse combination of Figure 2 after it has been bent into the U-shape;
- 30 Figure 4 is an exploded perspective view of the fuse combination as it is about to be inserted into a socket which has already received busbar contacts;
- 35 Figure 5 is a perspective view, partly in section, of the metal plate from which the fuse elements of the present invention are made;
- Figure 6 is a fragmentary cross section of the support showing one manner of affixing the fuse elements thereto;
- 40 Figure 7 is a cross section of the fuse combination prior to bending;
- 45 Figure 8 is a perspective view of the fuse combination of the present invention in a socket which, in turn, has had busbar contacts inserted therein;
- 50 Figure 9 is a perspective view of another embodiment of the fuse elements of the present invention;
- 55 Figure 10 is a view, similar to that of Figure 9, of a further modification of the fuse elements of the present invention; and

Figure 11 is a fragmentary plan view of a prior art device.

#### **DETAILED DESCRIPTION OF THE INVENTION**

[0012] Metal plate 12 has first and second portions 12a with third portion 12b therebetween. Third portion 12b is preferably thinner than either of the other two portions. As shown in Figures 1 to 8, a plurality of fuse elements 11 is stamped out of metal plate 12. Each fuse element 11 consists of first and second contacts 16 and fusible portion 20. The ends of contacts 16 are attached to bands 13 by connecting portions 14.

[0013] Insulative support 15 is provided with openings 22 and locking projections 19. At hinge 23, support 15 is reduced in thickness to assist in bending. Fuse elements 11 are placed on support 15 so that locking projections 19 fit into notches 16a, thereby positioning fuse elements 11 as required. Projections 19 are higher than the thickness of contacts 16 and, as shown in Figure 6, they are bent over the edges of the contacts in order to secure them to the insulative support. This can be accomplished, for example, by heat and pressure. Thereafter, bands 13 are removed by cutting connecting portions 14 and discarded.

[0014] Referring more specifically to Figures 2 and 3, support 15 is then bent or folded about hinge 23 into the U-shape as shown in Figure 3. Preferably, cover 21 is placed over at least fusible portions 20 for protection. It is preferred that cover 21 be transparent so that, if a fuse has melted due to a current overload, it can be visually detected.

[0015] Fuse combination is shown, for example, in Figure 4 as it is about to be inserted into socket 17. Socket 17 contains a plurality, corresponding to the plurality of fuse elements 11, of terminal chambers 25. Busbar contacts 26 from, for example, a circuit board, extend up into the terminal chambers. Fuse combination 29 is pressed downwardly (as shown in Figure 4) so that the outer walls of cover 21 fit into insertion walls 27. This properly positions fuse combination 29 and permits each of contacts 16 to enter its corresponding insertion opening 25a. When insulative support 15 is bent about hinge 23, cut out portions 28 are formed in which fusible portions 20 are located.

[0016] In a modification of the present Invention, as shown in Figure 9, a branched fuse is provided. Fuse elements 31 are electrically connected by connecting piece 33 which, in turn, is joined to contact 32. In Figure 10, a modification of the device of Figure 9 is shown. This branched fuse has connecting piece 33 electrically uniting all of fuse elements 31. However, there are two contacts 32 for appropriate circuitry.

[0017] The present Invention, as described and claimed herein, has numerous advantages over the fuse combinations previously known. To predetermine the amount of current which the fuse will tolerate, it is necessary that the cross sections of the fusible portions of

the fuse elements be carefully controlled. In accordance with the present Invention, this is accomplished by the provision of the metal plate having thick sections (which ultimately form the contacts) and a thin section (which ultimately forms the fusible portions).

[0018] Thus, by stamping or pressing the fuse elements from such a plate, the thicknesses of the fusible portions - and hence the maximum permitted current - can be easily controlled. The manufacturing process is quite simple and a large number of fuse elements can be produced at once. The thin portion of the metal plate can be readily and accurately formed by rolling or otherwise, thereby providing accurate control of the fusible portions and the current flowing therethrough. The Invention is of particular value where low current capacities are required.

[0019] Bands are provided on the ends of the fuse elements. These are formed at the same time - and in the same operation - as the fuse elements themselves. They serve to hold the elements in position with respect to each other so that the entire plurality may be handled at the same time. Once they are placed on the support, the latter can be bent into its U-shape, thereby forming all of the fuses in one operation. Grouping the fuses in this manner saves space and permits the fuses to be used in constricted areas. In addition, the structure of the inventive fuse combination permits insertion vertically into the receiving sockets. This minimizes the area required for installation and removal.

[0020] By providing openings through the support, the fusible portions are out of contact therewith. Thus, if a fusible portion melts, no smoke is generated, nor is any damage done to the support. Moreover, these openings allow dissipation of heat so that the substrate does not influence the melting of the fuse. This provides improved accuracy.

[0021] The provision of locking projections on the support and corresponding notches or holes in the contacts permits simple and foolproof attachment of the fuse elements. The projections position the fuse elements as well as retain them in position. Since the height of the projections is greater than that of the contacts, it is possible - as by the application of heat and/or pressure - to distort the ends of the projections so that they overlies edges or portions of the contacts. Alternatively, when holes are used, enlarged ends of the projections allow the fuse elements to be "snapped" into position and held there.

[0022] Since the undersides of the contacts are firmly affixed to the support, this tends to minimize variations in permitted current flow due to increases in temperature. The provision of a transparent cover not only protects the fusible portions, but also makes it possible to determine whether a fuse has melted by visual observation.

[0023] Although only a limited number of specific embodiments of the present Invention have been expressly disclosed, such changes as would be apparent to the

person of ordinary skill may be made without departing from the scope or spirit thereof. For example, bands 13 can be eliminated and the fuse elements placed on the support individually. The support may first be bent and the fuse elements affixed thereafter.

[0024] If desired, the insulative support can be provided with two sets of projections, one for positioning the fuse elements and the other for locking them. Instead of locking projections, the fuse elements may be soldered directly to the support. Also, it is not essential that the fusible portions be suspended apart from the insulative support. They can lie flat thereon and still perform their function.

[0025] As shown in Figures 9 and 10, branching circuits may be formed having the fuses all connected to a single contact and, if desired, any number of fusible portions may be provided, depending upon individual requirements.

#### Claims

1. A fuse combination comprising a plurality of fuse elements (11) arranged in a plane and an insulative support (15) therefor, said fuse elements comprising first contacts (16) at first ends of said fuse elements and second contacts (16) at second ends of said fuse elements, and fusible portions (20) between said first contacts and said second contacts, characterized in that said first contacts having first depths, said second contacts having second depths, and said fusible portions having third depths, said third depths being thinner than said first depths or said second depths, said fuse elements in parallel and spaced apart relationship to each other in said plane,

said support being generally complementary to said plane, having a dimension parallel to said plane and shorter than a distance between said first ends and said second ends, said support being provided with cavities (22) corresponding to said fusible portions, said fuse elements being affixed to said support.

2. The fuse combination of Claim 1 wherein said support, with said fuse elements secured thereto, is bent into a U-shape.
3. The fuse combination of Claim 2 wherein at least parts of said fusible portions extend over each of said cavities.
4. The fuse combination of Claim 2 wherein said fusible portions are enclosed in a transparent cover (21).
5. The fuse combination of Claim 1 comprising a first

band (13) connecting adjacent said first ends whereby said elements are held in said relationship.

6. The fuse combination of Claim 5 wherein said first band is adapted to be severed from said first ends after said fusible elements are affixed to said support.
7. The fuse combination of Claim 1 wherein said first contacts and said second contacts are provided with notched adjacent edges (16A), there being complementary units (19) on said support, said units bearing against said notches to secure said fuse elements to said support.
8. The fuse combination of Claim 1 wherein said first contacts and said second contacts are provided with holes (19) therethrough, there being upstanding locking projections on said support passing through said holes, whereby said fuse elements are secured to said support.

9. A method of making the fuse combination of Claim 1 from said support and a metal plate having a first portion (12a), a second portion (12a), and a third portion (12b) therebetween, said method comprising

formation of said fuse elements from said plate, whereby said first portion and said second portion constitute said first contacts and said second contacts, respectively, and said third portion constitutes said fusible portion,

placement of said fuse elements on said support whereby said first contacts and said second contacts engage upstanding complementary units on said support, whereby said fuse elements are secured to said support,

bending said support and said fuse elements into a U-shape about an axis passing through said cavities.

10. The method of Claim 9 wherein there is a first band connecting adjacent said first ends and a second band connecting adjacent said second ends, said method comprising

severing said first band from said first contacts and said second band from said second contacts after said placement.

11. The fuse combination of Claim 4 comprising a socket (17) having a plurality of insertion openings (25a) in a first surface thereof, said first contacts in said insertion openings and in electrical contact with terminals (18) therein, an insertion wall (27) on said

surface and perpendicular thereto, a lower portion of said transparent cover in said insertion wall.

12. The fuse combination of Claim 11 wherein said terminals are busbars mounted on a circuit board.
13. A fuse circuit comprising a socket for the fuse combination according to one of claims 1-8, 11 and 12 having a plurality of insertion openings (25a), said first contacts and said second contacts in said insertion openings and in electrical contact therewith, and busbar contacts in said terminal chambers and in electrical contact therewith.

#### Patentansprüche

1. Schmelzsicherungskombination mit einer Vielzahl von Sicherungselementen (11), die in einer Ebene angeordnet sind, und einem isolierenden Träger (15) dafür, wobei die Sicherungselemente erste Kontakte (16) an ersten Enden der Sicherungselemente aufweisen und zweite Kontakte (16) an zweiten Enden der Sicherungselemente, und schmelzfähige Teile (20) zwischen den ersten Kontakten und den zweiten Kontakten, dadurch **gekennzeichnet**, daß die ersten Kontakte eine erste Tiefe haben, die zweiten Kontakte eine zweite Tiefe und die schmelzfähigen Teile eine dritte Tiefe, wobei die dritte Tiefe dünner ist als die erste Tiefe und die zweite Tiefe, wobei die Schmelzsicherungselemente parallel und im Abstand voneinander in der Ebene angeordnet sind, und

daß der Träger im wesentlichen komplementär zur Ebene ist und eine Abmessung parallel zu der Ebene und kürzer als der Abstand zwischen den ersten Enden und den zweiten Enden hat, wobei der Träger mit Ausnehmungen (22) versehen ist, die den schmelzfähigen Teilen entsprechen, und wobei die Schmelzsicherungselemente auf dem Träger befestigt sind.

2. Schmelzsicherungskombination nach Anspruch 1, wobei der Träger mit den darauf befestigten Schmelzsicherungselementen in eine U-Form gebogen ist.
3. Schmelzsicherungskombination nach Anspruch 2, wobei mindestens Teile der schmelzfähigen Teile sich über jede der Ausnehmungen erstrecken.
4. Schmelzsicherungskombination nach Anspruch 2, wobei die schmelzfähigen Teile eingeschlossen sind in eine transparente Umhüllung (21).
5. Schmelzsicherungskombination nach Anspruch 1, mit einem ersten Band (13), welches nebeneinander

der liegende erste Enden verbindet, wodurch die Elemente in ihrem Abstandsverhältnis gehalten sind.

6. Schmelzsicherungskombination nach Anspruch 5, wobei das erste Band von den ersten Enden getrennt werden kann, nachdem die schmelzfähigen Elemente auf dem Träger befestigt wurden.
7. Schmelzsicherungskombination nach Anspruch 1, wobei die ersten Kontakte und die zweiten Kontakte mit gekerbten nebeneinanderliegenden Kanten (16a) versehen sind, wobei komplementäre Einheiten (19) auf dem Träger vorgesehen sind, welche an den Kerben anliegen, um die Schmelzsicherungselemente sicher auf dem Träger zu befestigen.
8. Schmelzsicherungskombination nach Anspruch 1, wobei die ersten Kontakte und die zweiten Kontakte mit Löchern (19) durch sie hindurch versehen sind, wobei auf dem Träger aufrechtstehende Sperrvorsprünge vorgesehen sind, die durch die Löcher hindurchgreifen, wodurch die Schmelzsicherungselemente an dem Träger sicher befestigt sind.
9. Verfahren zum Herstellen der Schmelzsicherungskombination gemäß Anspruch 1 aus dem Träger und einer Metallplatte mit einem ersten Teil (12a), einem zweiten Teil (12a) und einem dritten Teil (12b) dazwischen, wobei das Verfahren aufweist

Ausbilden von Schmelzsicherungselementen aus der Platte, wobei der erste Teil und der zweite Teil jeweils die ersten Kontakte und die zweiten Kontakte darstellen, und der dritte Teil den schmelzfähigen Teil bildet, Plazieren der Schmelzsicherungselemente auf dem Träger, wobei die ersten Kontakte und die zweiten Kontakte aufrechtstehende komplementäre Einheiten auf dem Träger kontaktieren, wodurch die Schmelzsicherungselemente an dem Träger sicher befestigt sind, und Biegen des Trägers und der Schmelzsicherungselement in eine U-Form um eine Achse, die durch die Kavitäten hindurchgreift.

#### 10. Verfahren nach Anspruch 9,

wobei ein erstes Band vorgesehen ist, welches nebeneinanderliegende erste Enden verbindet und ein zweites Band, welches nebeneinanderliegende zweite Enden verbindet, wobei das Verfahren aufweist Trennen des ersten Bandes von den ersten Kontakten und des zweiten Bandes von den zweiten Kontakten nach der Platzierung.

11. Schmelzsicherungskombination nach Anspruch 4, mit einem Sockel (17) mit einer Vielzahl von Einschuböffnungen (25a) in einer seiner ersten Flächen, wobei die ersten Kontakte in der Einschuböffnung und in elektrischem Kontakt mit Anschlüssen (18) darin liegen, und einer Einschubwandung (27) auf der Oberfläche und senkrecht dazu, wobei ein unterer Teil der transparenten Umhüllung in der Einschubwandung liegt.
12. Schmelzsicherungskombination nach Anspruch 11, wobei die Anschlüsse auf der Schaltungsplatte befestigte Sammelschienen sind.
13. Sicherungsschaltung mit einem Sockel für die Schmelzsicherungskombination nach einem der Ansprüche 11 oder 12 mit einer Vielzahl von Einschuböffnungen (25a), wobei die ersten Kontakte und die zweiten Kontakte in den Einschuböffnungen und in elektrischem Kontakt damit liegen, und mit Sammelschienenkontakten in der Anschlußkammer und in elektrischem Kontakt damit.

#### Revendications

1. Combinaison de fusibles comprenant une pluralité d'éléments de fusible (11) agencés dans un plan, et un support isolant (15) pour ces éléments, lesdits éléments de fusible comprenant des premiers contacts (16) aux premières extrémités desdits éléments de fusible et des deuxièmes contacts (16) aux deuxièmes extrémités desdits éléments de fusible, et des parties fusibles (20) entre lesdits premiers contacts et lesdits deuxièmes contacts, caractérisée en ce que lesdits premiers contacts ont des premières profondeurs, lesdits deuxièmes contacts ont des deuxièmes profondeurs et lesdites parties fusibles ont des troisièmes profondeurs, lesdites troisièmes profondeurs étant plus minces que lesdites premières profondeurs ou lesdites deuxièmes profondeurs, lesdits éléments de fusible étant mutuellement parallèles et espacés les uns des autres dans ledit plan,

ledit support étant sensiblement complémentaire audit plan, et ayant une dimension parallèle audit plan et plus courte qu'une distance entre lesdites premières extrémités et lesdites deuxièmes extrémités, ledit support comportant des cavités (22) en correspondance desdites parties fusibles, lesdits éléments de fusible étant fixés audit support.

2. Combinaison de fusibles selon la revendication 1, dans laquelle ledit support, auquel sont fixés lesdits éléments de fusible, est plié en forme de U.

3. Combinaison de fusibles selon la revendication 2, dans laquelle au moins des portions desdites parties fusibles s'étendent au-dessus de chacune desdites cavités.

4. Combinaison de fusibles selon la revendication 2, dans laquelle lesdites parties fusibles sont enfermées dans un capot transparent (21).

5. Combinaison de fusibles selon la revendication 1, comprenant une première bande (13) reliant les dites premières extrémités adjacentes de sorte que les dits éléments sont maintenus dans ladite relation d'espacement parallèle.

6. Combinaison de fusibles selon la revendication 5, dans laquelle ladite première bande peut être séparée desdites premières extrémités après fixation desdits éléments de fusible audit support.

7. Combinaison de fusibles selon la revendication 1, dans laquelle lesdits premiers contacts et les dits deuxièmes contacts présentent des bords adjacents à encoches (16A), des unités complémentaires (19) étant prévues sur ledit support, lesdites unités s'appliquant contre lesdites encoches pour fixer lesdits éléments de fusible audit support.

8. Combinaison de fusibles selon la revendication 1, dans laquelle lesdits premiers contacts et les dits deuxièmes contacts comportent des trous traversants (19), des saillies de blocage étant prévues en relief sur ledit support de façon à passer dans lesdits trous de sorte que lesdits éléments de fusible sont fixés audit support.

9. Procédé de fabrication de la combinaison de fusibles selon la revendication 1 à partir dudit support et d'une plaque de métal ayant une première partie (12a), une deuxième partie (12a) et une troisième partie intermédiaire (12b), ledit procédé comprenant :

la formation desdits éléments de fusible à partir de ladite plaque, de sorte que ladite première partie et ladite deuxième partie constituent lesdits premiers contacts et lesdits deuxièmes contacts, respectivement, et ladite troisième partie constitue ladite partie fusible,

la mise en place desdits éléments de fusible sur ledit support d'une manière telle que lesdits premiers contacts et lesdits deuxièmes contacts viennent en prise avec des unités complémentaires en saillie sur ledit support, de sorte que lesdits éléments de fusible sont fixés audit support ; et

le pliage dudit support et desdits éléments de fusible en forme de U autour d'un axe passant

par lesdites cavités.

10. Procédé selon la revendication 9, dans lequel il y a une première bande connectant lesdites premières extrémités adjacentes et une deuxième bande connectant lesdites deuxièmes extrémités adjacentes, ledit procédé comprenant :

la coupe de ladite première bande pour la séparer desdits premiers contacts, et de ladite deuxième bande pour la séparer desdits deuxièmes contacts après ladite mise en place.

11. Combinaison de fusibles selon la revendication 4, comprenant une douille (17) ayant une pluralité d'orifices d'insertion (25a) dans une première surface de la douille, lesdits premiers contacts dans lesdits orifices d'insertion venant en contact électrique avec des bornes (18) situées à l'intérieur, une paroi d'insertion (27) formée sur ladite surface et perpendiculaire à celle-ci, une partie inférieure dudit capot transparent étant logée dans ladite paroi d'insertion.

12. Combinaison de fusibles selon la revendication 11, dans laquelle lesdites bornes sont des barres omnibus montées sur une carte de circuit.

13. Circuit de fusibles comprenant une douille pour la combinaison de fusibles selon une quelconque des revendications 1 à 8, 11 et 12, ayant une pluralité d'orifices d'insertion (25a), lesdits premiers contacts et lesdits deuxièmes contacts étant logés dans lesdits orifices d'insertion et en contact électrique avec eux, et les contacts de barre omnibus étant logés dans lesdites chambres à borne et en contact électrique avec elles.
